Why python?

- Manipulating data files
- ► Simulations using others' programs

Why python?

- Manipulating data files
- Simulations using others' programs
- Web-related stuff

Why python?

- Manipulating data files
- Simulations using others' programs
- Web-related stuff
- Alternative to R for data analysis and graphics
- ▶ iPython notebooks

Python 2 vs Python 3

- Most people are using Python version 2.7
- Python 3 was introduced in 2008
 - A number of large changes
 - Some important Python programs haven't been ported
 - Few people seem to be using it day-to-day
- You should probably stick with Python 2
 - But be aware of differences

Installing Python

- ► On Mac or Unix, Python should be pre-installed python --version
- ► For Windows (or to be current, or to alternate between Python 2 and 3), install Anaconda

Includes NumPy, SciPy, Pandas, iPython, Matplotlib, ... continuum.io/downloads

Learning a new language

- Find a good book
- Have good example tasks/problems
- Play around
- Force yourself to use the new language
- Develop a script illustrating different language features

Into the thick of it

Learn Python through one example

```
\begin{array}{lll} \texttt{markers.txt} & & & \\ \texttt{families.txt} & & \longrightarrow & \\ \texttt{data.gen} \\ \texttt{genotypes.txt} \end{array}
```

Input: markers.txt

```

The top of the Python script

```
#!/usr/bin/env python
# Combine the data in "genotypes.txt", "markers.txt" and
# "families.txt" and convert them into a CRI-MAP .gen file
# This is the python 2 version
def read markers (filename):
  "Read an ordered list of marker names from a file."
  with open(filename, 'r') as f:
    lines = f.readlines()
  return [line.strip() for line in lines]
class Person:
  "Person class, to contain the data on a subject."
  def __init__ (self,family, id, dad, mom, sex):
    self.family = family
    self.id = id
    self.dad = dad
    self.mom = mom
    \underline{\text{self.sex}} = "0" if \underline{\text{sex}} = "2" else \underline{\text{sex}} \# \underline{\text{convert}} 1/2 -> 1/0
    self.famid = family + '-' + id
    self.gen = {}
```

The bottom of the Python script

```
if name == ' main ':
 # file names
 gfile = "genotypes.txt" # genotype data
 mfile = "markers.txt" # list of markers, in order
 ffile = "families.txt" # family information
  ofile = "data.gen" # output file
 # read the data
 markers = read markers(mfile)
 people = read_families(ffile)
 read_genotypes(gfile, people)
 # write the data
  write genfile (ofile, people, markers)
```

Write functions & modules not scripts

- Write a set of reusable functions
- Your code will be easier to read
- You may actually reuse the code, this way

Try it out

```
$ convert2.py
$ diff data.gen data_save.gen
```

```
$ python
                 # (or ipython)
>>> import convert2
>>> help(convert2)
>>> help(convert2.read_markers)
>>> markers = convert2.read.markers("markers.txt")
>>> markers[0]
>>> len(markers)
>>> markers[-1]
>>> markers[0:2]
>>> markers[0:-1]
>>> markers[5:]
>>> markers[:5]
>>> markers[0:7:2]
>>> quit()
```

Read the marker names

```
def read_markers (filename):
   "Read an ordered list of marker names from a file."
   with open(filename, 'r') as f:
    lines = f.readlines()
   return [line.strip() for line in lines]
```

class Person

```
class Person:
   "Person class, to contain the data on a subject."
   def __init__ (self, family, id, dad, mom, sex):
      self.family = family
      self.id = id
      self.dad = dad
      self.mom = mom
      self.sex = "0" if sex == "2" else sex # convert 1/2 -> 1/0
      self.famid = family + '-' + id
      self.gen = {}
```

Example use:

```
ind = Person("1", "3", "1", "2", "2")
```

read_families

```
def read_families (filename):
    "Read family info and return a hash of people."
    with open(filename, 'r') as file:
        file.readline() # header row
        people = {}
        for line in file:
        vals = line.strip().split()
        person = Person(vals[0],vals[1],vals[2],vals[3],vals[4])
        people[person.famid] = person
    return people
```

read_genotypes

```
def parse_genotype (string):
  "Clean up string -> genotype"
  string = string.replace(' ', '')
  string = "0/0" if string == "" else string
 return string.replace('/', ' ')
def read genotypes (filename, people):
  "Read genotype data, fill in genotypes within people hash"
 with open(filename, 'r') as file:
    header = file.readline().strip().split()
    header = header[1:] # omit the first field, "Marker"
    for line in file:
     marker = line[:9].replace(' ', '')
      line = line[9:]
      for i in range(len(header)):
        person = header[i]
        start = i*7
        people[person].gen[marker] = \
          parse_genotype(line[start:(start+7)])
```

Some helper functions

write_genfile

```
def write_genfile (filename, people, markers):
  "Write genotype data to a file, in CRI-MAP format."
 with open(filename, 'w') as file:
    families = sorted(get families(people))
    writeln(file, len(families))
    writeln(file, len(markers))
    for marker in markers:
      writeln(file. marker)
    for family in families:
      writeln(file, family)
      members = sorted(get_family_members(people, family), \
                       key=lambda person: int(person.id))
      writeln(file, len(members))
      for person in members:
        writeln(file, "%s %s %s %s" % (person.id, \
                person.mom, person.dad, person.sex))
        for marker in markers:
          writeln(file, person.gen[marker], " ")
        writeln(file, "")
```

The bottom of the Python script

```
if name == ' main ':
 # file names
 gfile = "genotypes.txt" # genotype data
 mfile = "markers.txt" # list of markers, in order
 ffile = "families.txt" # family information
  ofile = "data.gen" # output file
 # read the data
 markers = read markers(mfile)
 people = read_families(ffile)
 read_genotypes(gfile, people)
 # write the data
  write genfile (ofile, people, markers)
```

Basic types

```
► float
```

$$x = 0.3$$

► int

$$m = 5$$

▶ string

$$s = "blah"$$

▶ bool

► None

$$x = None$$

► complex

$$x = 5+0j$$

Converting between types, and such

```
n = 5
type(n)
s = str(n)
x = float(n)
"%s %s %s" % (n, s, x)
"%d %d %d" % (n, int(s), x)
"%.2f %.2f %.2f" % (n, float(s), x)
dir(s)
dir(x)
s = "blah"
len(s)
s[2:]
s[:-1]
for ch in s:
 print ch
```

Multi-element types

▶ list

```
x = [1, 2, 3, None, "blah"]
y = [ [ 1, 2 ], [ 3, 4, 5 ], 6 ]
```

dictionary

$$h = {'x': 3, 'y': 5, 'name': "Karl"}$$

▶ tuple

$$x = (1, [2,3])$$

▶ set

$$S = set([5, 3, 5, 1, 2, 1])$$

matrices as lists of lists

```
x = [ [1, 2, 3, 4], [5, 6, 7, 8], [9, 10, 11, 12] ]
x[1][3]
```

for loops

```
vec = range(4)
for x in vec:
  print (x+1)**2
import math
for i in xrange(len(vec)):
  print math.log( vec[i] + 1 )
h = \{ 'x':3, 'y':4, 'z':2 \}
for k in h:
  print k, h[k]
for k in sorted(h.keys()):
  print k, h[k]
for k,v in h.iteritems():
  print k, v
for v in h.itervalues():
  print v
```

list comprehensions

```
vec = range(10)
[v**2 for v in vec if v > 5]

h = {'x':3, 'y':4, 'zz':2}
[h[k]**2 for k in h]
[h[k]**2 for k in h if len(k) == 1]
[[k, v**3] for k,v in h.iteritems()]
dict( [[k, v**3] for k,v in h.iteritems()] )

x = [k+1 for k in range(6)]
y = [True, False, True, False, False, False]
[x[i] for i in range(len(x)) if y[i]]
```

Unit tests: Nose

```
# This is nosetest_convert2.py
#
# At command line, type "nosetests nosetest_convert2.py"

from nose.tools import assert_equal
from convert2 import *

def test_parse_genotype():
    assert_equal(parse_genotype(" "), "0 0")
    assert_equal(parse_genotype("100/98 "), "100 98")
    assert_equal(parse_genotype("90/96 "), "90 96")
    assert_equal(parse_genotype("90/96 "), "90 96")
    assert_equal(parse_genotype("90/96 "), "90 96")
    assert_equal(parse_genotype("3 / 8 "), "3 8")
```

Unit tests: unittest

```
#!/usr/bin/env python
# Test one of the functions in convert2.py
# on the command line, type "test_convert2.py"
import unittest
from convert2 import *
class check parse genotype(unittest.TestCase):
 def test_parse_genotype(self):
                                            "), "0 0")
   self.assertEqual(parse_genotype("
   self.assertEqual(parse_genotype("100/98 "), "100 98")
   self.assertEqual(parse_genotype("90/96"), "90 96")
   self.assertEqual(parse_genotype("90/ 96 "), "90 96")
   self.assertEqual(parse_genotype(" 3 / 8 "),
                                                 "3 8")
if __name__ == '__main__':
 unittest.main()
```

Summary

- ► Learn a scripting language, like Python
 - Not just for manipulating data files, but worth the effort just for that.
- ► Force yourself to use it
